

1. Given a list of Strings containing groups of numbers separated by empty strings find the value of the highest valued group. eg: {"1", "2", "", "40", "2", "", "4"} = three groups with values 3, 42 and 4. Highest value is 42.
2. Create a Money class, a money object should have both a quantity and currency.
  - Money objects should be immutable. Create methods for adding/subtracting/dividing/multiplying two money objects. (How should you deal with different currencies?)
  - Money objects should be ordered by currency name (alphabetic order) and then value. Update the money class
